TrendScout · architecture evidence

LOCAL SYNTHETIC DEMO ACTIVE | YouTube live, derived processing and production activation: PENDING APPROVAL | Not production evidence

Current local synthetic execution — implemented and exercised offline

Public dashboard
Anonymous user; one Fetch button; keyword filters, evidence and source status.

→

FastAPI
Capabilities + bounded Fetch API; Origin/Host checks; no client-supplied provider or secret.

→

Admission / queue
Local SQLite state; idempotency, quota and concurrency limits. Local only.

→

Worker
Fixed four-source synthetic handlers; checkpoints and source statuses.

→

Processing / storage
Source evidence → keyword extraction → insufficient-evidence status; temporary local state.

Proposed YouTube path — implemented components, not connected to public live Fetch

Owner approval gate
Provider usage, quota, cost and security approval required. No live calls in this evidence.

→

Backend credential resolver
Local owner-only configuration; API key never sent to browser.

→

Quota / worker
Fixed local ledger; one attempt/source. Volatile checkpoints; local composition not attached to HTTP.

→

YouTube adapter
YouTube Data API v3 search gateway; fixed endpoint; live not verified.

→

Policy gates
YouTube-derived processing remains blocked pending appropriate permission. Retention/deletion workflow is incomplete.

D5/D6 code: app/demo_local.py, api/fetches.py, jobs/public_admission.py, workers/d5_source_handlers.py, sources/youtube and sources/live_gateway.py. Firestore and multi-host production are separate, unverified tracks. Local source includes uncommitted D6 work; the deployed app may differ. 12 Nov 2026.
